IT Incident Management & Troubleshooting Portfolio

Scenario 1: Company-Wide ISP Outage

Ticket ID: NET17918715760531
Priority: High
Status: Resolved in simulator

Problem: Wi-Fi disconnected repeatedly, causing three video calls to drop.

Troubleshooting Steps:

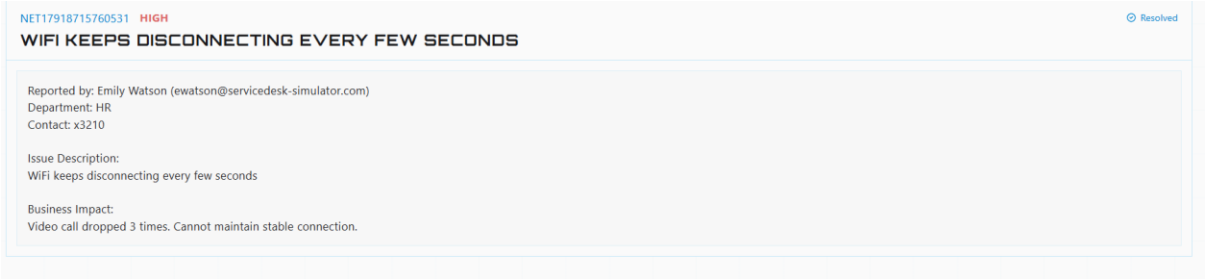

1. Open the incident ticket.
2. Navigate to Server Room.
3. Open the Metro ISP device.
4. Click Check ISP Status.
5. Confirm whether the status is ISP DOWN.
6. Record the estimated restoration time shown in the simulator.
7. Prepare an outage announcement using the confirmed information.
8. Verify recovery when evidence is available.

Root Cause: Upstream ISP outage, as identified by the simulator.

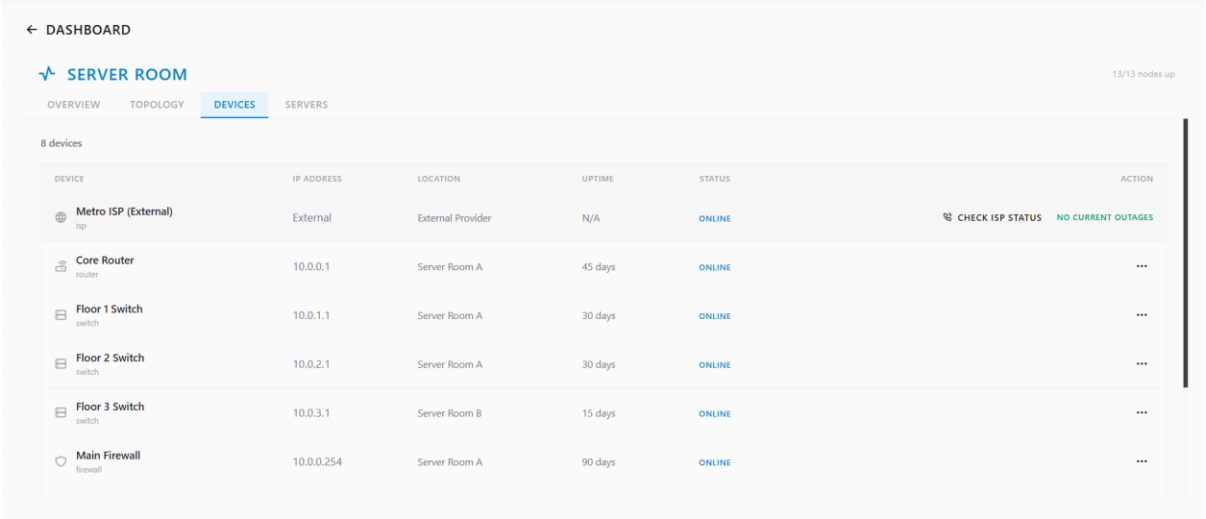

Resolution Approach: Communicate the outage and confirmed ETA instead of repeatedly rebooting individual computers.

Screenshots Required:

- Screenshot 1: Incident ticket details.

- Screenshot 2: Metro ISP status showing ISP DOWN.

Evidence Note: The exact ETA and confirmation that the announcement was posted were not recorded.

Scenario 2: Intermittent Wi-Fi Disconnection

Ticket ID: NET17914439150561
Priority: High
Status: Resolved in simulator

Problem: Wi-Fi disconnected repeatedly, interrupting three video calls.

Troubleshooting Steps:

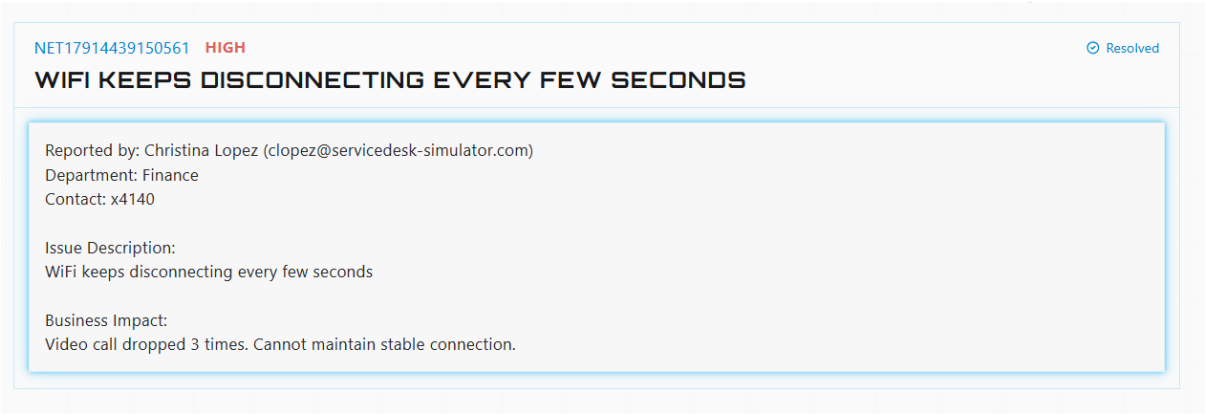

1. Open the incident ticket.
2. Check the reported symptoms.
3. Determine whether the problem is isolated or affects multiple users.
4. In this simulator scenario, allow the temporary connection interruption to recover.
5. Confirm that the connection is stable again.
6. Communicate the recovery through Company Chat.
7. Record the result.

Root Cause: Temporary, self-recovering network interruption according to the simulator.

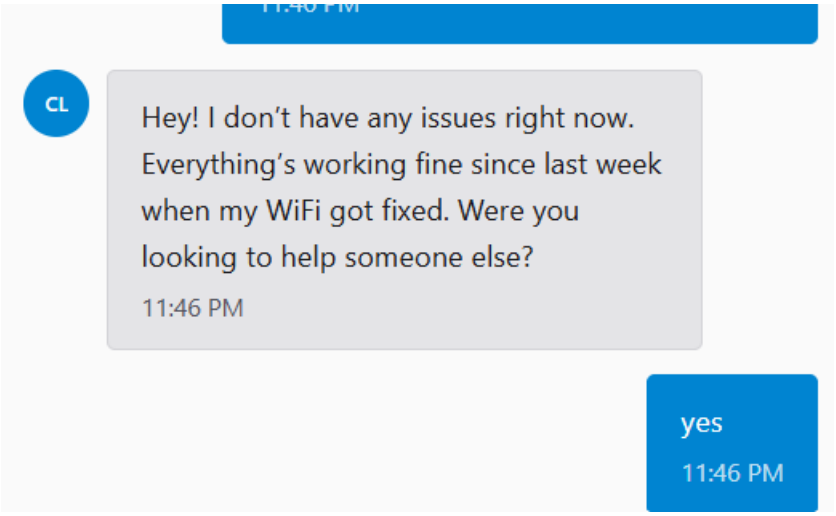

Resolution: The connection recovered automatically without a reboot, according to my notes.

Screenshots Required:

- Screenshot 1: Wi-Fi incident ticket details.

- Screenshot 2: Connection recovery or user confirmation, if available.

Evidence Note: Use only genuine recovery evidence available from the simulator.

Scenario 3: VPN Disconnected and Won't Reconnect

Ticket ID: NET17914438850630
Priority: High
Status: Resolved in simulator

Problem: A remote employee could not reconnect to the VPN or access internal resources.

Troubleshooting Steps:

1. Confirm the user is working remotely.
2. Use the authorized remote-support workflow in the simulator.
3. Open the terminal.
4. Run ipconfig /flushdns to clear the Windows DNS resolver cache.
5. Follow the simulator's prescribed restart and VPN reconnection workflow.
6. Check whether the VPN tunnel is online.

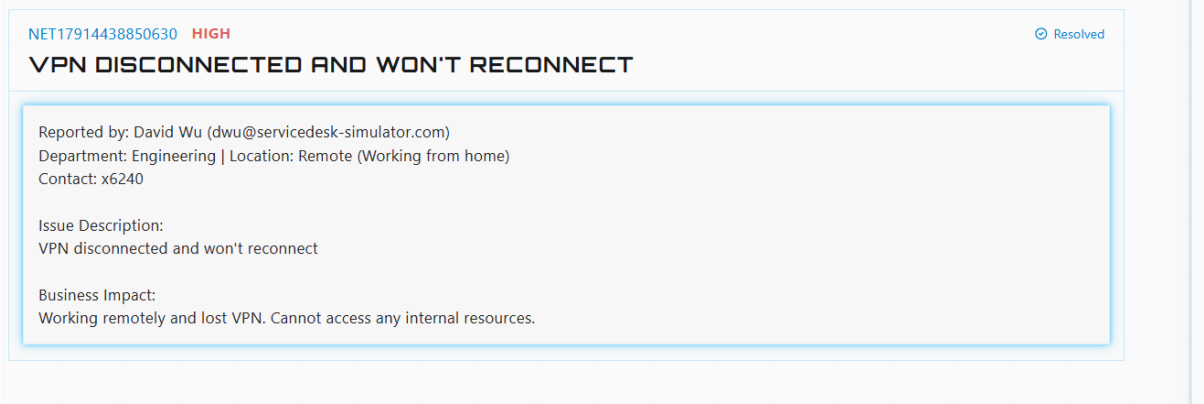

7. If the problem continues, investigate further or escalate.

Recorded Action: I cleared the DNS cache using ipconfig /flushdns.

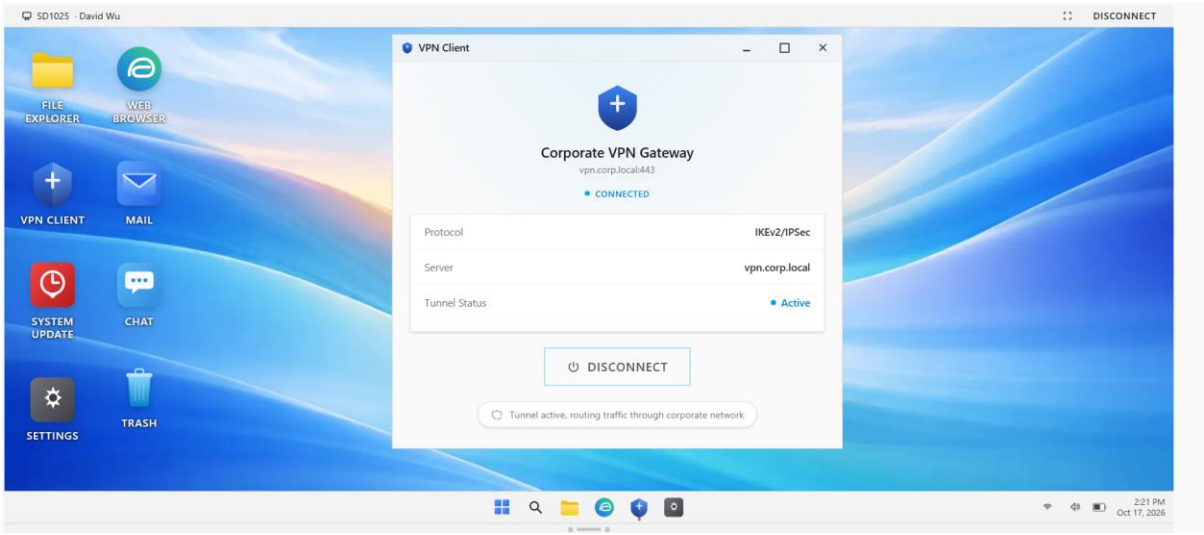

Resolution: The ticket was marked resolved in the simulator. The final VPN verification result was not recorded in my notes.

Screenshots Required:

- Screenshot 1: VPN incident ticket.

- Screenshot 2: Actual command output or VPN-connected status, if available.

Security Note: Never share normal passwords or verification codes through insecure channels. Clearing DNS cache does not guarantee that a VPN problem will be fixed.

Scenario 4: New Employee Account Setup

Ticket ID: INC0012853
Priority: Medium
Status: Resolved in simulator

Problem: A new employee needed an account and appropriate access before starting work.

Required Groups:

- Engineering
- VPN-Users
- CodeRepo-Access

Troubleshooting and Implementation Steps:

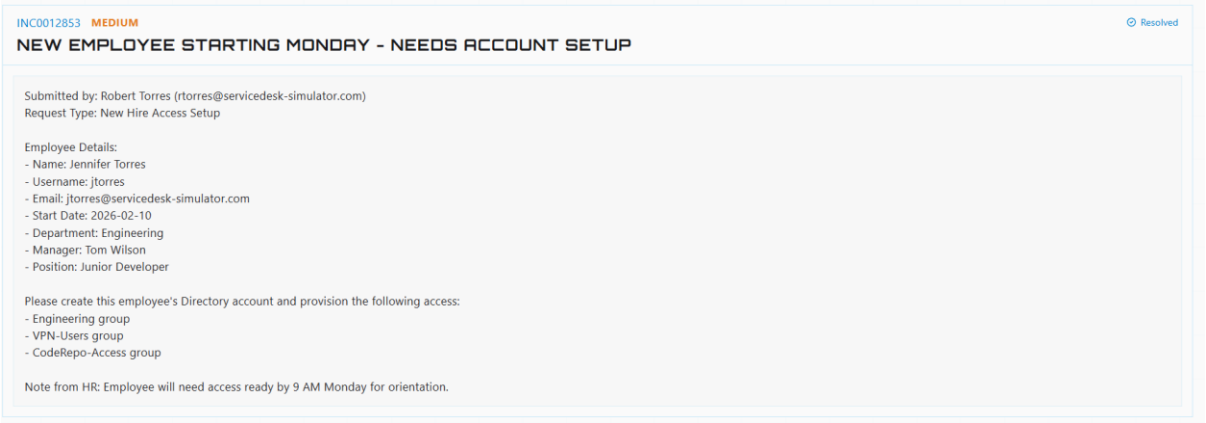

1. Review the account request and start date.
2. Navigate to Tools → Directory.
3. Select New User.
4. Enter the approved username and user details.
5. Create the account.
6. Search for the newly created account.
7. Add the requested group memberships.
8. Verify the account and assigned groups.

Recorded Action: I created the user through Directory → Add User.

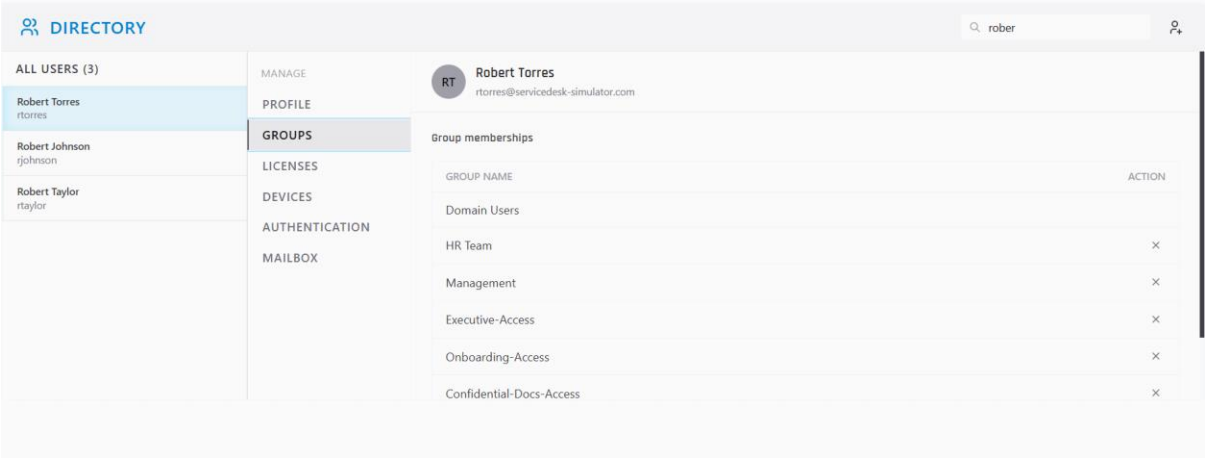

Resolution Approach: Create the account and provision the authorized access requested.

Screenshots Required:

- Screenshot 1: Account-setup ticket.

- Screenshot 2: User account and required group memberships, if available.

Security Lesson: Grant only the access approved for the employee's role.

Scenario 5: Department Transfer and Access Modification

Ticket ID: INC0012860
Priority: Medium
Status: Resolved in simulator

Problem: An employee was transferring from Engineering to IT Infrastructure and needed their access updated.

Troubleshooting and Implementation Steps:

1. Verify that the transfer request is authorized.
2. Navigate to Tools → Directory.
3. Search for the employee's account.
4. Remove the old Engineering group membership.
5. Add the approved IT Infrastructure group membership.
6. Verify the updated group memberships.
7. Document the changes.

Recorded Action: I updated the account's group membership and removed Engineering access.

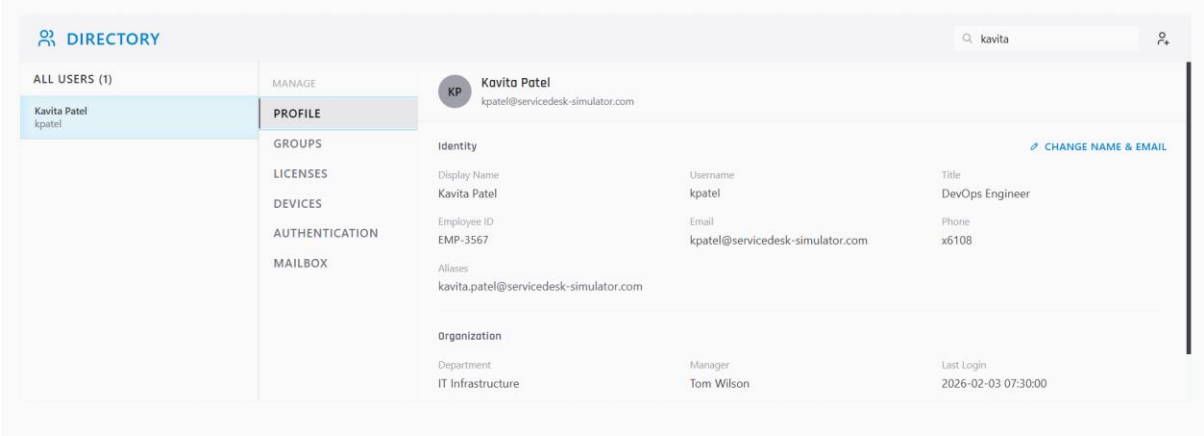

Resolution Approach: Modify access to match the employee's new department.

Screenshots Required:

- Screenshot 1: Department-transfer ticket.

- Screenshot 2: Updated group memberships, if available.

Security Lesson: Remove unnecessary old permissions and grant only authorized new permissions.

Scenario 6: Expired Password and Login Failure

Ticket ID: INC0012855
Priority: High
Status: Resolved in simulator

Problem: An employee returned from a three-week vacation and could not log in because the password had expired.

Troubleshooting Steps:

1. Confirm the login issue.
2. Verify the employee's identity using the approved process.
3. Navigate to Tools → Directory.
4. Search for the employee's account.
5. Open the Authentication tab.
6. Follow the simulator's verification workflow.
7. Reset the password using the approved process.

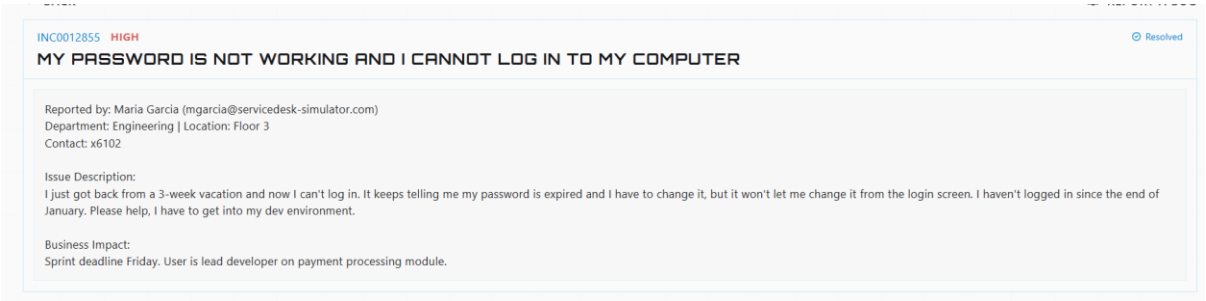

8. Require a password change at first login.
9. Verify that the employee can sign in.

Recorded Action: I sent a verification code and reset the password.

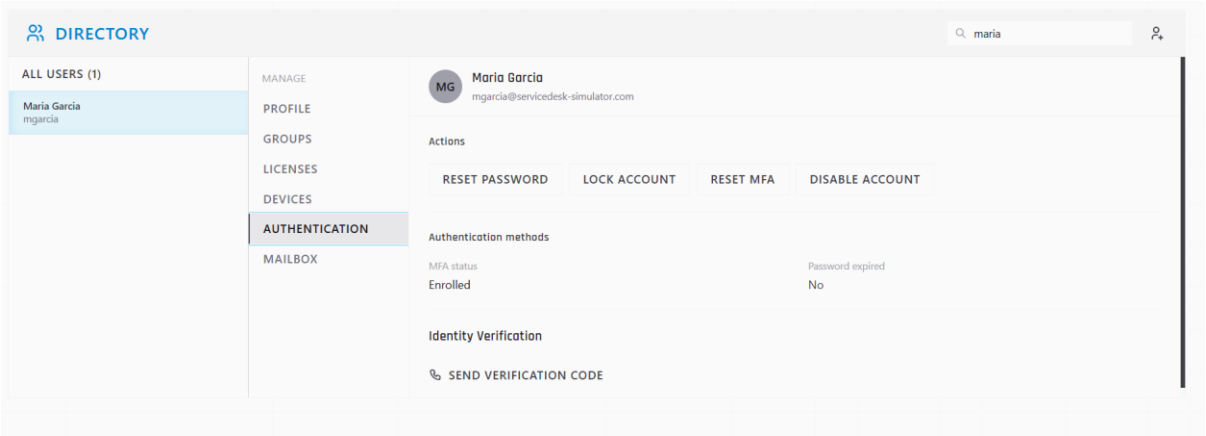

Resolution Approach: Complete the password reset after identity verification.

Screenshots Required:

- Screenshot 1: Password issue ticket.

- Screenshot 2: Reset or verification completion screen, if available.

Security Note: Never publish passwords, temporary credentials, or verification codes in screenshots or GitHub files.

Scenario 7: Office-Wide Printer Outage

Ticket ID: INC0012870
Priority: High
Status: Resolved in simulator

Problem: All office printers appeared offline, preventing employees from printing important documents.

Troubleshooting Steps:

1. Confirm whether multiple printers or users are affected.
2. Navigate to Tools → Server Room.

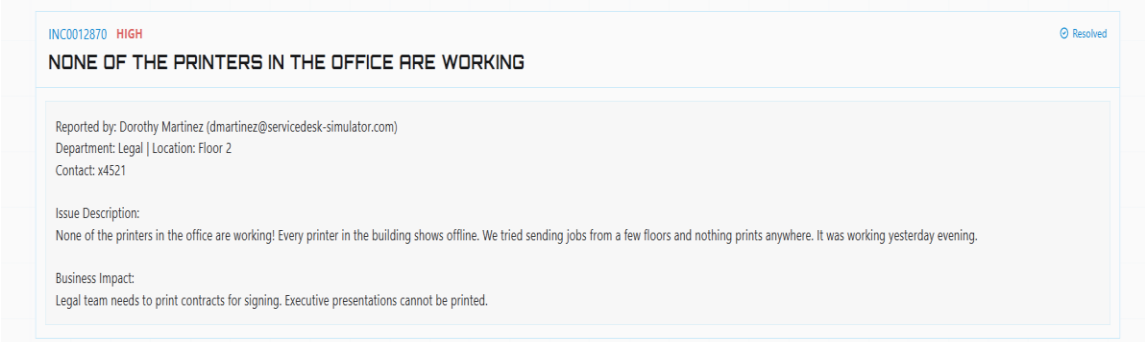

3. Open the Servers tab.
4. Locate the PRINT01 server.
5. Check its status.
6. Follow the simulator's recovery workflow if the server is down.
7. Wait for the server to return online.
8. Ask the user to test printing.
9. Record the result and verify recovery.

Recorded Action: I rebooted the printer/server device in the Server Room.

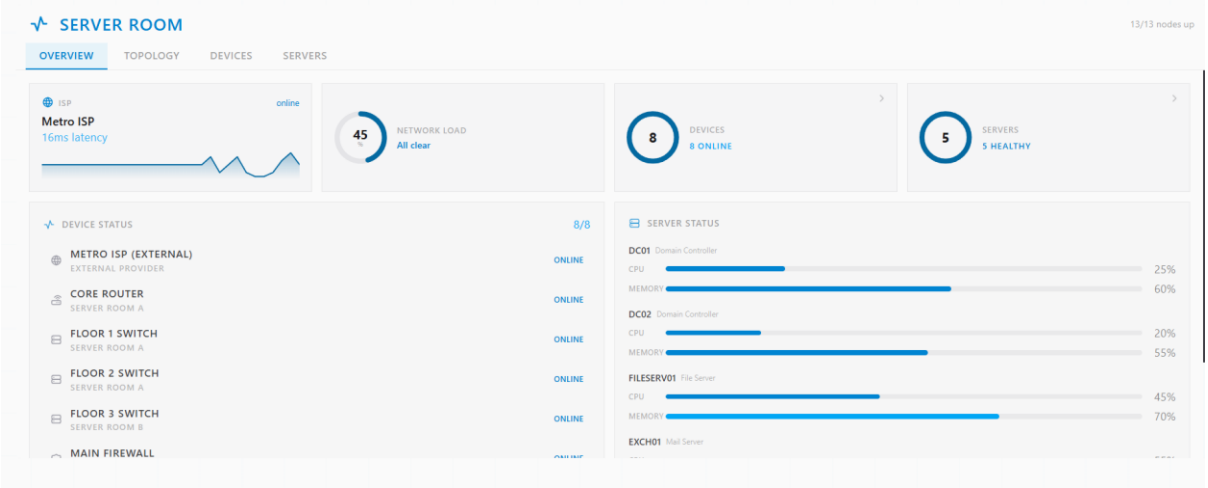

Likely Cause: Shared print server failure, according to the simulator's intended workflow.

Screenshots Required:

- Screenshot 1: Printer outage ticket.

- Screenshot 2: PRINT01 server status or recovery confirmation, if available.

Real-World Note: Check the server status and follow authorization and change procedures before restarting shared infrastructure.
